# Initial/Preliminary Evaluation

| Section/Aspect | Details | Score |
|---|---|---|
| Intro | The intro is okay, it does its job. | 10 |
| Feature List/ Business Requirements/ Functional specification | This section is great, it establishes all the important requirements that need to be implemented, provides links to the relevant sections and overall explains very well what needs to be implemented in high-enough detail, without getting bogged down in the details. | 10 |
| Business Flows | The specification correctly filters out simple interactions and focuses on complex workflows. However, the second diagram could also include saving the file through the “Save” button click. The import CSV diagram seems to be checking if there are 32 sheets but from the information from the error message, it should check if there are more than 32 sheets, this could be written more clearly. | 9 |
| Non-Functional Requirements | I think this section is pretty good, the limits are pretty thorough and clear up some things that would otherwise be unclear if this section did not exist (such as decimal precision). Moreover, most of the NFRs seem to be quite clear as well. However, some of the limits are a bit strange (why are the row/column limits so low, 10 000 and 702 respectively). Also, NFR-12 assumes React. Still, these are minor issues, so it feels petty to deduct points for them. | 10 |
| High-Level Architecture | On one hand, this section is pretty good. The design of the Core components seems to be quite clear and well thought out (this is partly because many of the classes/components are described in the Functional Specification). The application components and package diagram sections are well-made as well, nothing noticeably wrong is written there.<br>On the other hand, we don’t like the designing team’s choice to design the system around React, which is non-binding, but the point still stands. | 9 |
| UI/UX Wireframes | The wireframes are detailed. For each interface element, there is a number, an explanation of its behaviour and the feature it relates to. Consistency between screens and business cases is visible. | 10 |
| Data Model | Well-made, pretty clear and generally matches what is written in the rest of the document. Though there are some small inconsistencies that we’ve noticed so far. In section 6.3, it is mentioned that the “Parser” produces a syntax tree and stores it per cell, which is not reflected in the Data Model (stores values only). Moreover, this section does not describe how the syntax tree looks. | 9 |
| Overall | Overall, this is generally a pretty good document. It is densely packed, as it manages to convey quite a lot of useful information in just 25 pages, which is pretty difficult to do: it doesn’t feel like much space is wasted. The document is also rather clear as well. There are some minor imperfections and that is generally expected. One thing that we don’t really care for is that the designing team designed the system with React in mind. | 10 |

# Project Scope

The table below shows which functional requirements we feel confident we can implement by December 14th.

| Id | Requirement | Can we implement it? |
|---|---|---|
| F-01 | Cell Input | Yes. |
| F-02 | Formulas | Yes. |
| F-03 | Value formats | Yes. |
| F-04 | Cell colours | Yes. |
| F-05 | Copy, cut and paste | Yes. |
| F-06 | Undo and redo | Yes. |
| F-07 | Workbook files | Yes. |
| F-08 | CSV import and export | No. |
| F-09 | Multiple sheets | Yes. |
| F-10 | Locale | No. |
| F-11 | Recovery copy | No. |
| F-12 | Menus, toolbar and shortcuts | Yes. |
| F-13 | Error logs | Yes. |
| F-14 | Column width and row height | No. |
| F-15 | Auto-save | No. |
| F-16 | Find | No. |
| F-17 | Border | Yes. |
| F-18 | Insert and delete rows and columns | No. |

Firstly, it should be noted that if our team finds enough time to complete all the requirements we had initially set out to implement and has time to spare, we may implement some of the other requirements that we have outruled.

Requirements F-01 through F-03 are the logical core of MiniSheets, hence they absolutely have to be implemented. F-05 to F-07 and F-09 are also needed for the program to be useful, same goes for F-12. F-04 is not as essential, but useful nonetheless. F-13 is useful for any team developing a program. F-14 through F-18 are all part of the “Should” and “Could” categories and are not essential to the functioning of the program, hence they aren’t included (with the exception of F-17, which seems quite simple to implement). F-11 is similarly non-essential. That leaves F-10 and F-08, which although would be nice to have, we believe are more trouble than it’s worth, though if we do have the time to implement additional functionality, these requirements would have top-priority.

Regarding the non-functional requirements, we will attempt to implement all of them, though we are not yet aware of how realistic they are, therefore that goal might change. Still, it is important to clarify some things. NFR-12 may not entirely apply to our implementation if we decide to choose another framework besides React, however, since our team will attempt to implement the architecture specified in the architecture, we will keep the testability part of the requirements. NFR-10 will only apply to the “Must” features that we can implement. Moreover, since we will not be implementing F-11, NFR-07 makes no sense as a result. Similarly, NFR-05 limit “Recovery copy interval” will also not be implemented.

# Project Specifics

Although the designing team specified in their document that the use of “TypeScript with React for Windows” is strictly required in the implementation of the project, given the fact that the implementing team has the right to choose any programming language they want for implementation, we have chosen to use another language instead (specifically C# with the Avalonia framework).

Furthermore, the repository for the implementation of our project is: “https://github.com/JAFAR-JSON/MiniSheets/”.
